

“Role of Diagnostic Stewardship during a Public Health Emergency: COVID-19”

PACCARB, September 2020

Kalvin Yu, M.D.
Medical Director
Becton, Dickinson & Co.

Outline

1

Diagnostics: critical to public health

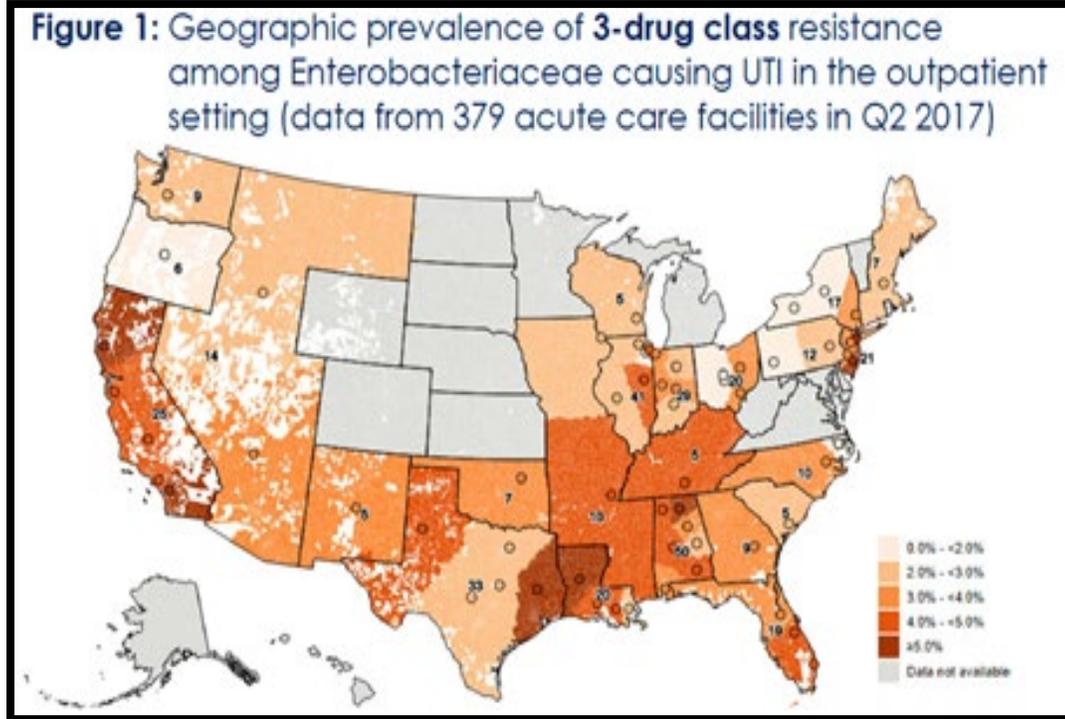

2

COVID-19 and AMR: insights from the hospital setting

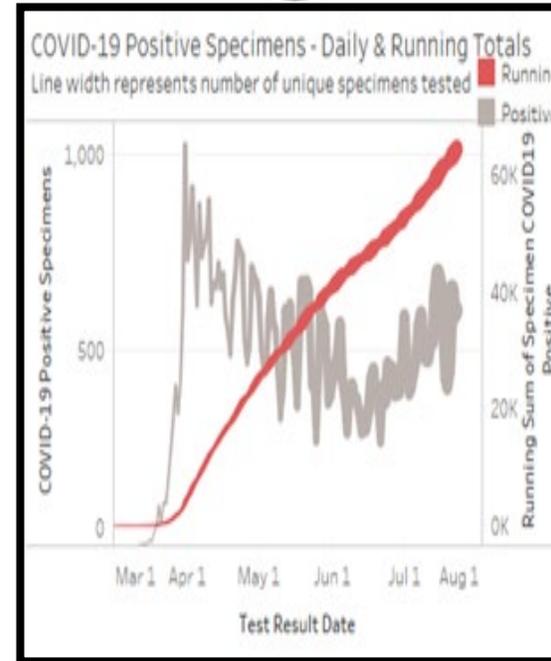

3

Executive Summary

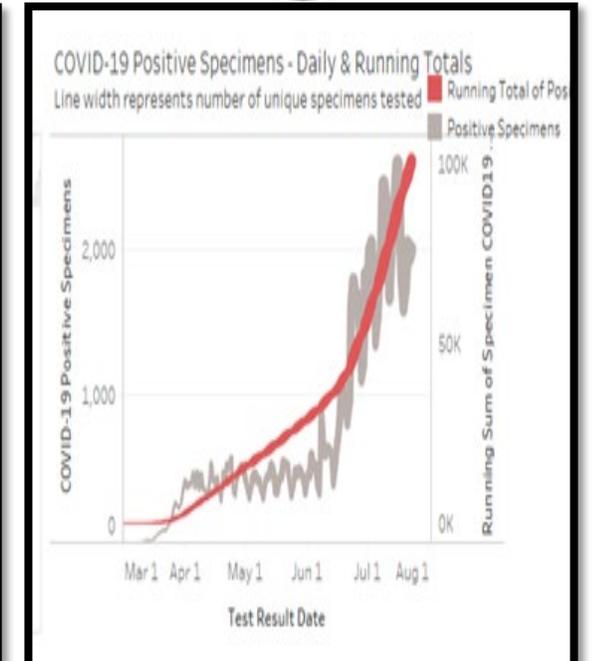

Diagnosics support surveillance, uncovering trends that can help inform clinician practice

Overall decrease with later small increase**

Sudden step increase

If there is 3-drug resistance, your options for treatment are limited*

“What has happened in the past?”

Different Trends may help inform different local and state level public health policies

“What is feasible in the future?”

- “The prevalence of Enterobacteriaceae resistant to all major classes of oral antibiotics from outpatient urine cultures in the United States and effect on clinical outcomes,” Presented 2018 ID week
- **BD insights newsletter, <https://www.bd.com/en-us/clinical-excellence/covid-19-insights-analytics/bd-insights-issue-2>

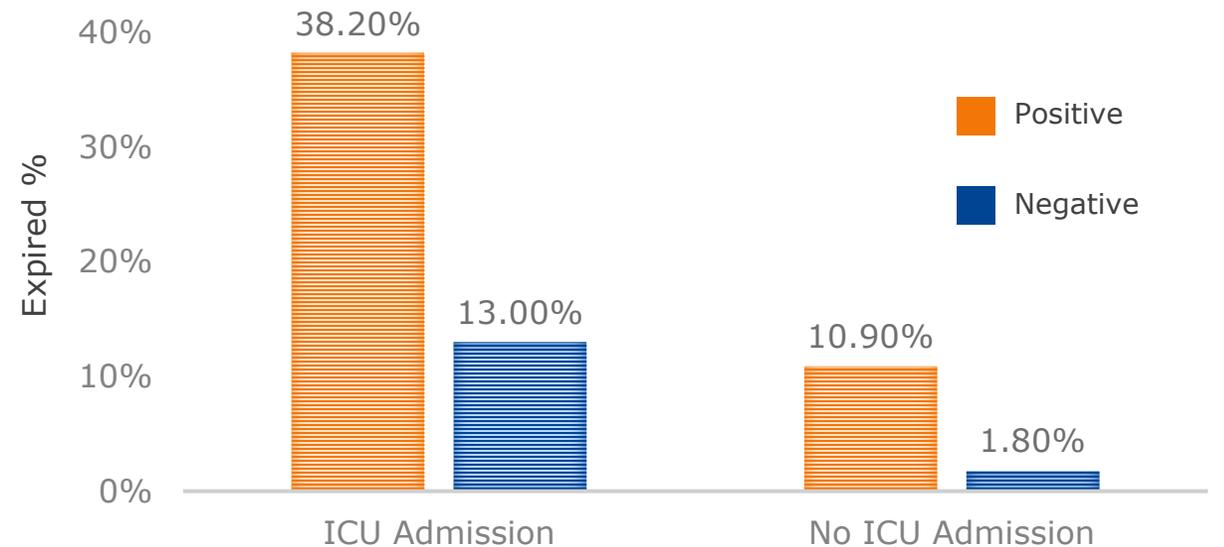

Insights on hospital Length of Stay (LOS) & Mortality

Diagnostic tests inform hospital care:

COVID+ patients (vs COVID -) have*:

- Higher mortality (both ICU and non-ICU areas)
- longer length of stay
- Higher rate % needing ICU care
- Optimizing resources
 - Medication management
 - vaccine stores
- Risk stratification**

	Admit	Col. %	ER Admit	AVG. LOS	ICU Admits	Avg. ICU LOS
Negative	131,123	87.0%	47.6%	5.4	17.5%	3.9
Positive	19,675	13.0%	57.0%	9.3	24.3%	8.1
Grand Total	150,798	100.0%	48.8%	5.9	18.4%	4.7

Diagnosics and stewardship: antibiotics use

	COVID+	COVID-
Length of Stay	8.7 days	5.1 days
% in ICU	24%	17%
Culture+	20.9%	21.4%
Antibiotic Use	68%	46%

- COVID+ and COVID negative patients: same bacterial/fungal culture positive rate
- 22% more antibiotic use (key agents: 3rd, 4th gen. cephalosporins, vancomycin, macrolides)

More antibiotic use drives antibiotic resistance

Diagnosics enable clinician action

Category	SARS-CoV-2 + (n=17,075)	SARS-CoV-2 - (n=124,979)	Total SARS-CoV-2 Tested (n=142,054)
% Male	9,053 (53%)	58,114 (46%)	67,167(47%)
Age (mean (SD); median years)	61.7 ± 18.0 (63)	58.5 ± 20.9 (62)	58.9 ± 20.6 (62)
Overall LOS (mean (SD); median days)	8.7 ± 12.9 (6)	5.1 ± 9.0 (3)	5.5 ± 9.6 (3)
ICU Admissions, n (%)	4,034 (24%)	20,969 (17%)	25,003 (18%)
ICU LOS (mean (SD); median days)	7.9 ± 8.5 (5.0)	3.8 ± 6.2 (2.0)	4.5 ± 6.8 (2.2)
Admissions with culture positive	3487 (20.9%)	24539 (21.4%)	28026 (21.3%)
Admissions Prescribed Antimicrobials* (duration ≥ 24 hours; n (%))	11,681 (68%)	56,809 (46%)	68,490 (48%)
Culture Positive Hospital LOS (mean (SD); median days)	13.8 ± 16.1 (9)	8.3 ± 11.8 (5)	9.0 ± 12.6 (6)
Admission to Abx Start (mean (SD); median hours)	9.2 ± 51.9 (0)	9.9 ± 50.8 (0)	9.8 ± 51.0 (0)
3rd/4th Gen Cephalosporins	8,643 (74%)	33,750 (59%)	42,393 (62%)
Glycopeptides	3,630 (31%)	21,719 (38%)	25,349 (37%)
Macrolides	8,036 (69%)	16,264 (29%)	24,300 (35%)
β-lactam/β-lactamase inhibitors	3,175 (27%)	19,073 (34%)	22,248 (32%)
Fluoroquinolones	1,277 (11%)	9,689 (17%)	10,966 (16%)
1st/2nd Gen Cephalosporins	560 (5%)	8,705 (15%)	9,265 (14%)
Tetracyclines	2,386 (20%)	6,386 (11%)	8,772 (13%)
Carbapenems	1,083 (9%)	5,025 (9%)	6,108 (9%)
Antifungals	658 (6%)	4,229 (7%)	4,887 (7%)
Anti-influenza agents	933 (8%)	998 (2%)	1,931 (3%)

*EPIDEMIOLOGY OF ANTIMICROBIAL USE AMONG SARS-COV-2 POSITIVE AND NEGATIVE ADMISSIONS IN THE US: A MULTICENTER EVALUATION, ID week 2020

Diagnosics and stewardship: a deeper dive

COVID-19+ Patients*:

- High rate of **Staph aureus** culture positive
- Greater **Pseudomonas** vs COVID-
- Greater **Candida** vs COVID-

Why does this matter?

Staph aureus, Pseudomonas, and Candida all have multidrug resistant strains and often lead to poor outcomes**

How can diagnostics help?

Diagnostics enable clinician action:

- **Differentiating** multi drug resistant vs sensitive
- **Definitive therapy faster** may = better outcomes
- **Less** broad/unnecessary antibiotics *may help AMR*
- **Innovation:** Point of care, faster TAT helps facilitate

Pathogen Type	SARS-COV-2 Positive	SARS-COV-2 Negative	Total
Total Pathogens*^	6,057	48,051	54,108
Culture Positive Hospital LOS (mean (SD); median)	13.8 ± 16.1 (9)	8.3 ± 11.8 (5)	9.0 ± 12.6 (6)
Culture Negative Hospital LOS (mean (SD); median)	7.5 ± 11.7 (5)	4.6 ± 8.4 (3)	4.9 ± 8.9 (3)
Gram-positive	1,832 (30.2%)	14,992 (31.2%)	16,824 (31.1%)
<i>S. aureus</i>	746 (40.7%)	6,710 (44.8%)	7,456
Enterococcus spp.	575 (31.4%)	4,024 (26.8%)	4,599
<i>S. pneumoniae</i>	99 (5.4%)	546 (3.6%)	645
Gram-negative	2,423 (40.0%)	18,421 (38.3%)	20,844 (38.5%)
Enterobacteriales	1,860 (76.8%)	14,128 (76.7%)	15,988
<i>P. aeruginosa</i>	410 (16.9%)	2,481 (13.5%)	2,891
<i>A. baumannii</i> spp.	27 (1.1%)	162 (0.9%)	189
Fungi/mold	470 (7.8%)	2,378 (4.9%)	2,848 (5.3%)
<i>Candida</i> spp.	365 (77.7%)	1,657 (69.7%)	2,022
<i>Aspergillus</i> spp.	6 (1.3%)	121 (5%)	127
Non-COVID-19 Virus	547 (9.0%)	5,421 (11.3%)	5,968 (11.0%)

Diagnositics in a public health crisis: Every cold/flu season strains healthcare systems

TAT for SARS-CoV-2 Tests*:

Without flu

1.5 to 6 days

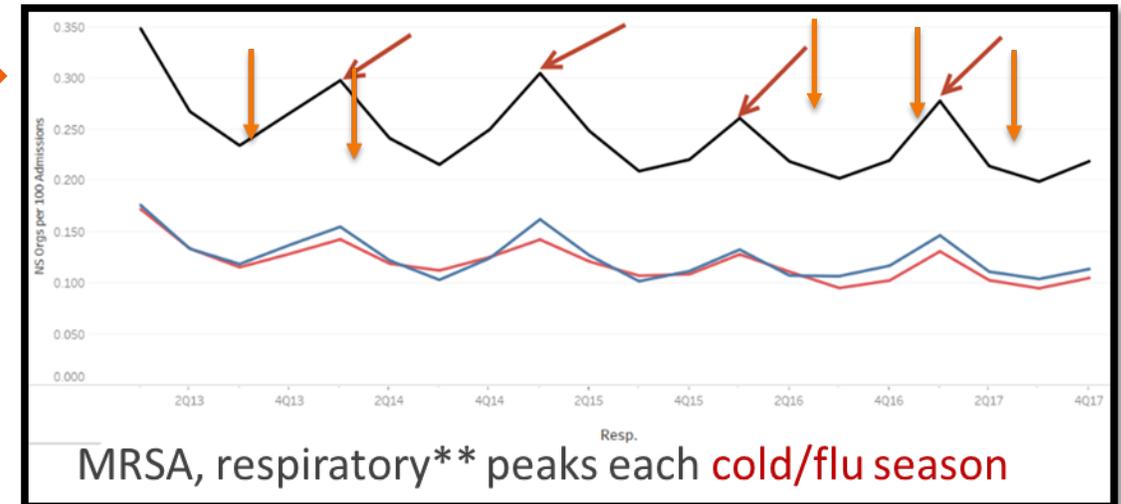

What will happen to TAT during the 2020 cold/flu season?

Surge Capacity during Cold/Flu Season:

- Resistant infections peak during **cold/flu season** without COVID**
- Resources are lower; “pandemic pay”/**back to work**
- Cold + Flu + COVID = larger potential for confusion
 - How will you distinguish fever and cough?

Triaging patients and prioritizing resources with **diagnostics** will be **crucial for hospital bed availability**

Executive Summary

Diagnostic tests during a pandemic: value to clinicians, patients and challenges

Diagnostics enable identification & **surveillance** that can inform clinicians, policy makers and businesses

Diagnostic result **TAT (turn around time)** has been an issue for SARS-CoV-2 tests. This will be crucial for surge capacity cold/flu season. We need a **ramp up strategy** for microbiology diagnostics.

In-hospital **mortality** in COVID-19 positive patients is higher than COVID-19 test negative comparators

Antibiotic (over)use and AMR risk: COVID-19+ patients were on key antibiotics 68% vs 46% in the COVID-19 negative cohort, even though they both had the same bacterial/fungal culture + rate (21%).

Challenges:

1. **TAT** for COVID-19 tests
2. **POC** diagnostics: a path to patient care improvement & AMR mitigation
3. **Stockpile strategy** for flu/pandemics
4. **Education and allocation of resources strategy** of appropriate diagnostics deployment and use. **Crucial in surge capacity** situations.
